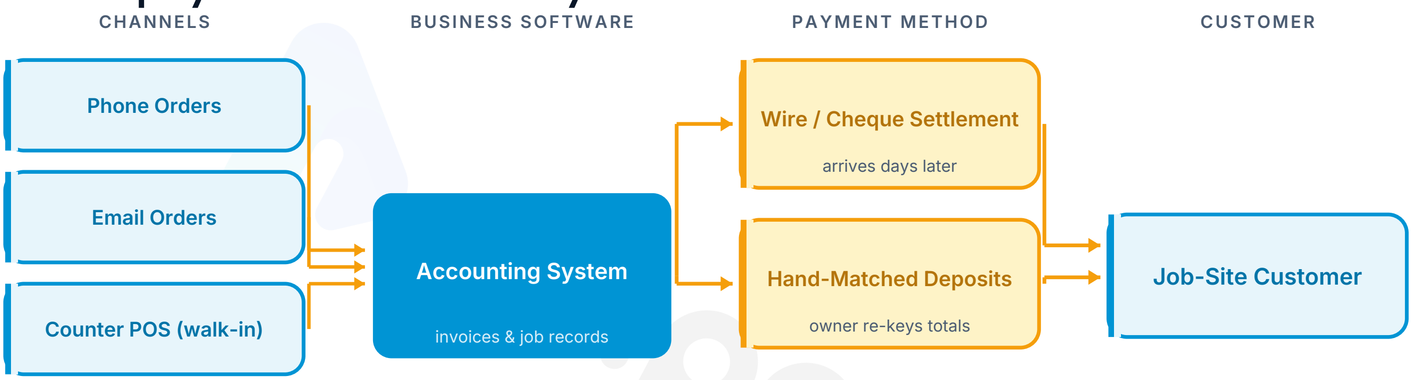
For Single-Point Ready-Mix Supplier, we reviewed how payments currently move through your business. The purpose of this review is not to recommend changing providers. Its purpose is to visualize today's payment operation, identify manual work, explain why it matters, and highlight opportunities to simplify how deposits, balances, and settlement move through your business.

CURRENT PAYMENT FLOW

How a payment moves today



Systems, channels, automation · Manual touchpoint — key, write, reconcile · Optimized / automatic

CURRENT OPERATIONAL HEALTH

Ten areas, at a glance

Manual Processing
The owner hand-matches every deposit slip to an invoice and re-keys totals into the accounting system.

Automation
Deposits, balance capture, settlement, and reconciliation are each handled by hand.

Payment Visibility
An order is not secured until payment arrives days later, so the picture stays open through delivery.

Fraud Exposure
Card verification is not used at deposit, so there is no secure token to fall back on.

Reconciliation
Matching cheques and wires to invoices is a recurring manual task, not a one-click sync.

Remote Payments
There is no secure link to collect a deposit when an order is placed over the phone or email.

Customer Experience
Customers who would prefer to pay by card are pushed onto slower wire or cheque rails.

Reporting
Days-to-cash on each job depends on when a wire or cheque happens to arrive.

Chargeback Protection
Orders are booked on trust with nothing held on a card, leaving cancellation risk with the supplier.

Accounting Integration
Deposit totals are entered into the accounting system line by line rather than flowing in on their own.

CURRENT WORKFLOW

Today, step by step

- Customer
- 2 Places order by phone or email
- 3 Dispatch schedules the truck
- 4 Concrete delivered · invoice sent
- 5 Business waits for wire or cheque
- 6 Second invoice for the balance
- 7 Owner deposits at the bank
- 8 Totals re-keyed into accounting

An advance order is booked on trust: the customer commits by phone or email, dispatch schedules the truck, and an invoice is sent expecting payment by wire or cheque. Because concrete jobs rarely bill for exactly the quoted amount, a second invoice usually follows for the balance — and another wait. When the money finally arrives, the owner deposits it at the bank, matches each slip against an invoice, and re-keys the totals into the accounting system line by line. The days between order and payment are where the real exposure sits, because the order is not yet secured.

OPTIMIZED WORKFLOW

The same business, simplified

- Customer
- 2 Taps a secure deposit link at order
- 3 Deposit secures the order · card on file
- 4 Concrete delivered · actuals confirmed
- 5 Balance captured from card on file
- 6 Funds settle next business day
- 7 Accounting lines reconcile automatically

WORKFLOW COMPARISON

What changes, in plain terms

Order booked on trust	→	Deposit secured at order time
Second invoice for the balance	→	Balance captured from card on file
Wire or cheque, days later	→	Funds settle next business day
Physical bank deposit	→	Secure remote payment
Totals re-keyed by hand	→	Automatic reconciliation

OPERATIONAL FINDINGS

What we observed

1 No secure deposit when the order is placed

CURRENT SITUATION

Advance orders are booked on trust — the customer commits verbally, dispatch schedules the truck, and an invoice is sent expecting a wire or cheque. Nothing is charged or held on a card at the moment the order is placed.

WHY IT MATTERS

Between order and delivery, cancellation risk sits entirely with the supplier — a dispatched truck represents fuel, plant time, and driver hours committed before any payment. Chasing an unresponsive customer after delivery is far harder than collecting a deposit up front.

SUGGESTED IMPROVEMENT

Hosted Payment Page

A secure deposit link sent when the order is booked.

WHAT THIS MEANS IN PLAIN ENGLISH

Instead of dispatching a truck on trust and waiting for a wire, the customer secures the order by paying a deposit on a secure page from their phone in a couple of minutes.

> INDUSTRY PERSPECTIVE
>
> Across the payment industry, hosted payment pages let the customer enter their own card details directly, so no card numbers are exchanged over the phone and the business never handles the card. Because the cardholder is present and verified at the moment of payment, these transactions generally represent lower fraud risk than manually keyed payments.

2 No card on file for the final balance

CURRENT SITUATION

Concrete jobs almost never bill for exactly the quoted amount — delivered metres, wait time, and pump draws all shift the final number. Today, capturing the balance means issuing a second invoice and waiting again for another wire or cheque.

WHY IT MATTERS

Every job produces a second collection cycle for the difference between quote and actuals, and customers routinely leave balances outstanding for weeks after the concrete is poured. There is no way to charge the confirmed amount cleanly.

SUGGESTED IMPROVEMENT

Card-on-File

The verified card held safely against the job for the final balance.

WHAT THIS MEANS IN PLAIN ENGLISH

Instead of issuing a second invoice and waiting again for the balance, the confirmed final amount is charged to the card already held on file against the job.

> INDUSTRY PERSPECTIVE
>
> Card-on-file arrangements store a securely tokenized card so a later, related charge can be taken without handling the card number again. Card networks generally require the initial payment to be authenticated before a card can be stored, which is why the deposit verification and the balance charge are linked in this model.

3 Wire and cheque settlement is slow

CURRENT SITUATION

Wire transfers arrive on the sender's schedule, and cheques require a physical bank deposit and a hold before funds are usable. Money for a job delivered early in the week may not be workable until the following week, and the owner then hand-matches each slip to an invoice.

WHY IT MATTERS

Slow days-to-cash tightens working capital on every job cycle, and physical bank trips take owner time that could go to sales or dispatch. Hand-matching deposits to invoices is a recurring task, and when a payment is short or wrong the whole cycle repeats.

SUGGESTED IMPROVEMENT

Automated Reconciliation

Card settlement connected to the accounting system.

WHAT THIS MEANS IN PLAIN ENGLISH

Instead of the owner hand-matching each slip to an invoice and re-keying totals, the deposit and balance lines match to the accounting system on their own.

> INDUSTRY PERSPECTIVE
>
> Automated reconciliation is used across the payment industry to match captured transactions to settlement records without manual re-keying, which generally improves reporting accuracy and shortens days-to-cash. Card payments typically settle to the business account within a business day or two, depending on the processor agreement, so the owner reviews exceptions rather than chasing wires and cheques.

4 Customers have no card option

CURRENT SITUATION

Some customers would prefer to pay by card — for cashflow, for rewards on large jobs, or because their accounts-payable process runs through a corporate card. Today the only choices are wire or cheque; a card path is not offered at order time or at the balance stage.

WHY IT MATTERS

Business and corporate cards are a common accounts-payable tool in the trades, and buyers who would happily pay by card are pushed onto slower rails they do not prefer. Losing a large job because a card could not be taken is avoidable.

SUGGESTED IMPROVEMENT

Secure Payment Link

A card option offered alongside existing wire and cheque.

WHAT THIS MEANS IN PLAIN ENGLISH

Instead of pushing every customer onto wire or cheque, buyers who prefer to pay by card get a secure link — and those who prefer the old rails keep them.

> INDUSTRY PERSPECTIVE
>
> Business and corporate cards are a common accounts-payable tool, and card networks make secure remote payment methods available so a buyer can pay by card without card numbers being exchanged directly. Offering a card option generally widens the ways a customer can pay, while wire and cheque remain available for those who prefer them.

IMPROVEMENT OPPORTUNITIES

Six places to simplify

Reduce manual entry

Let deposits and balances flow in through a secure link instead of arriving as slips to re-key. The owner reviews exceptions rather than typing totals line by line.

Improve payment visibility

Know an order is secured the moment it is placed, not days later. A deposit on the card gives an immediate, clear signal that the job is real.

Simplify reconciliation

When the payment path connects to the accounting system, deposit and balance lines match on their own. The nightly slip-matching task becomes a quick review.

Reduce fraud exposure

Verifying the cardholder at deposit puts a secure token on file against the job. The confirmed balance can be charged cleanly without handling card numbers.

Improve the customer payment experience

Give buyers a fast, tap-once deposit link at order time and a clean receipt for the full amount. Wire and cheque stay available for the customers who prefer them.

Improve the accounting workflow

Next-business-day settlement and automatic accounting lines replace the wait-and-match cycle. Days-to-cash tightens and working capital frees up on every job.

SUMMARY & NEXT STEPS

A note on this review

This review summarizes our understanding of your payment operation. It is intended to begin a conversation, not recommend changing providers. If anything does not accurately reflect your business, we encourage you to let us know — every business is different, and this review is a starting point for discussion.

QUESTIONS WORTH DISCUSSING

Worth raising with your current provider

- Could an order be secured with a deposit at the moment it is placed, rather than days later?
- Could the final balance be captured cleanly without issuing a second invoice?
- Could funds settle in a day or two instead of waiting on a wire or cheque?
- Could deposit and balance lines match to invoices on their own?
- Could customers who prefer to pay by card be offered that option alongside wire and cheque?
- Could your current provider already support some of these improvements?
